

Testing a Wordfast Server TM Connection with Wordfast Pro (version 5 or higher)

## To test your connection to a Wordfast Server (WFS) TM:

- Generate a WFS account URL (see WFS Quickstart Guide). This URL looks something like this: wf://account:password@10.11.12.13:47110/1234567890
  - It contains the following information:
    - a. Account Login and Password (e.g. account:password)
    - b. IP address (e.g 10.11.12.13)
    - c. Port# (usually 47110 by default)
    - d. An optional Workgroup ID (e.g. 1234567890)
- 2. Open Wordfast Pro and click on the *Quick Tools* icon.

3. Under the *Analysis* tab, click on the *Connect to Remote* icon.

								vitm			

- 4. Click on the *WF Server* tab (1).
- 5. Enter a name for the TM in the *Symbolic Name* field (2), paste the account URL into the *URL* field (3) and then click on *Test* (4).

Symbolic Name:* 2	TM Name							
URL Settings								
URL:*	wf://demo_fr_enus2:password@162.2 4 Test							
Address:*	162.242.							
Port:*	47110							
Account Name:*	demo_fr_enus2							
Account Password:	password							
Workgroup ID:								
PM and TM admin								
Use TM (Write) Password								
TM (Write) Password:								
	Connection successful							
	OK Cancel							

6. You should see a message at the bottom that says "Connection successful."

## Problems?

- 1. Make sure WFS is running and that the *Server active* box is ticked under the *Activity* tab.
- 2. If attempting a WAN connection (i.e. remote connection), make sure you have opened your firewall to communicate through port 47110.
- 3. See the troubleshooting section the WFS manual as the problem may be more complicated and related to your router settings.

## Next steps...

1. Provide users with the WFS account URL so they can add a Remote TM to a project (see Project Quickstart Guide for translators and PMs).
