Wordfast Server Quick Start Guide 1.4

Downloading, installing, and licensing Wordfast Server (WFS)

1. Download the latest version of WFS directly from [here](#) and save it to your Windows machine.
2. Unzip the *WfServer.zip* download and you will have three files: *WfServer.exe*, *WfServerRelay.exe*, and the *WfServer.pdf* user manual. Create a WFS folder in your preferred location and move the two .exe files there. Place the WFS user manual wherever is convenient.
3. Double-click *WfServer.exe* from your WFS folder to launch the WFS interface.
4. WFS will be running in demo mode (indicated by the blinking red notification in the upper right). Go to the **Setup** tab > **General** option and you will see your 12-digit **Install #**. To retrieve your license, send an e-mail to sales@wordfast.com containing the 12-digit install number AND your WFS version (1.0.12.xxxx), which is displayed in the title bar of the interface. Be sure to copy and paste the **Install #**.

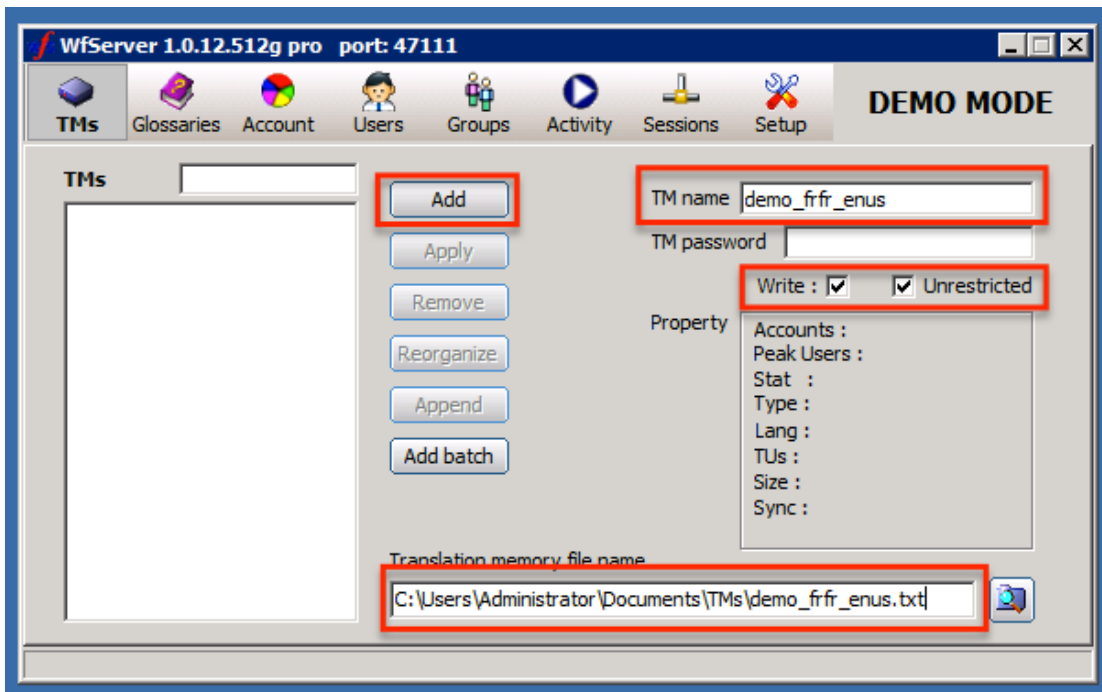

5. When you receive your license key via email from Wordfast, go to the **Setup** tab > **General** option in WFS, enter it in the **License #** field just below the **Install #** field, click the **Activate** button, and restart the WFS application by closing the window and then double-clicking *WfServer.exe*.

Creating a new TM

1. To create a new TM in WFS go to the **TMs** tab, type the name that you wish to give the TM in the **TM name** field. Do not assign a password in the **TM password** field (this is for more complicated workflows).
2. Check the **Write** box, then check the **Unrestricted** box.¹

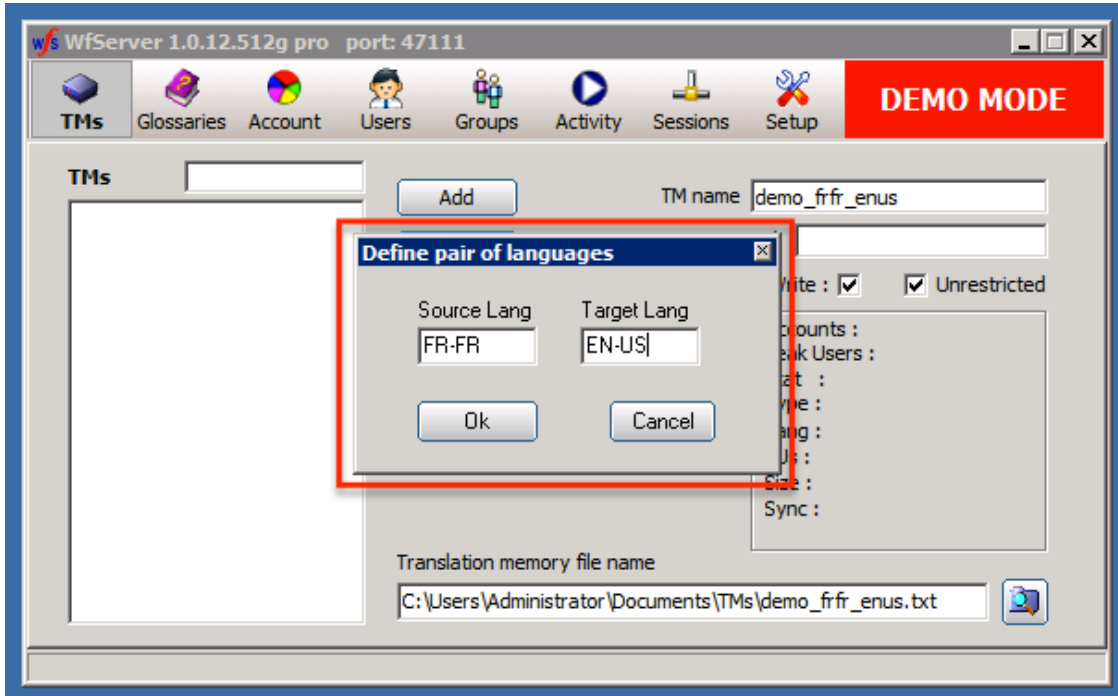

3. Type the **file path**, the **TM name** you chose in step 6, and **.txt** in the **Translation memory file name** field (e.g. **C:\Users\Administrator\Documents\Tms\demo_fr_enus.txt**). You can also browse to the location by clicking on the  icon, type in the TM name with or without ".txt" and then click on **Save**.

¹ If the **Write** box is checked, the added TM is in read-write mode. If the **Unrestricted** box is checked, users can write TUs to the TM **without** a Workgroup ID. When writing to a TM **with** a Workgroup ID (using WFP), those TUs will only be shown to users working with the same Workgroup ID. Writing TUs to the TM without a Workgroup ID means that those TUs will be visible to all users, regardless of their Workgroup ID. **For the simplest workflow**, check both boxes and do not use Workgroup IDs in WFP.

Wordfast Server Quick Start Guide 1.4

4. Click the **Add** button. You will be prompted to enter the source and target language codes.

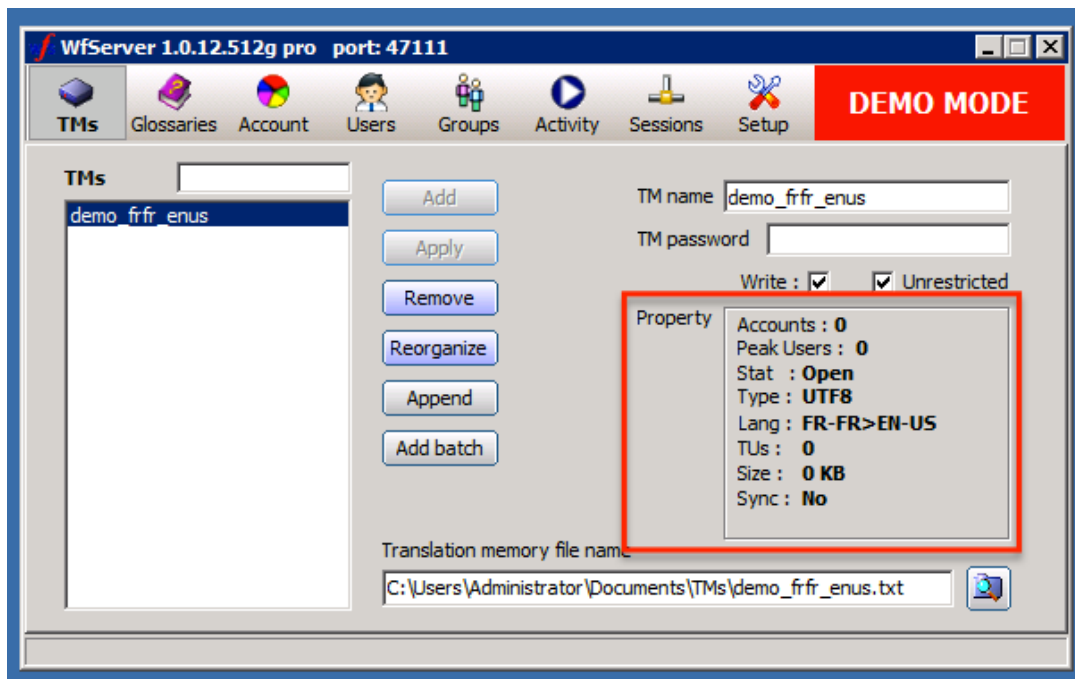

If you do not know the codes or are unsure, please [click here](#) for examples. You must use the proper language codes. You will then be prompted to Re-organize the TM. Click **Yes**. The TM should now appear in the TMs list on the left-hand side. Information about the TM will appear in the **Property** box.

Wordfast Server Quick Start Guide 1.4

Adding a pre-existing TM

1. To add a pre-existing TM file, the TM .txt file must be physically located on the same machine where WFS is installed. In WFS, go to the **TMs** tab in WFS and enter a name in the **TM name** field.
2. Check the **Write** box, then the **Unrestricted** box (see footnote on page 2).
3. Click the browse icon  on the bottom right, locate the Wordfast-compatible .txt TM file that you wish to connect, and click **Save**.
4. Click the **Add** button. You will be prompted to Re-organize the TM. Click **Yes**. The TM should now appear in the TMs list on the left-hand side. Information about the TM will appear in the **Property** box.

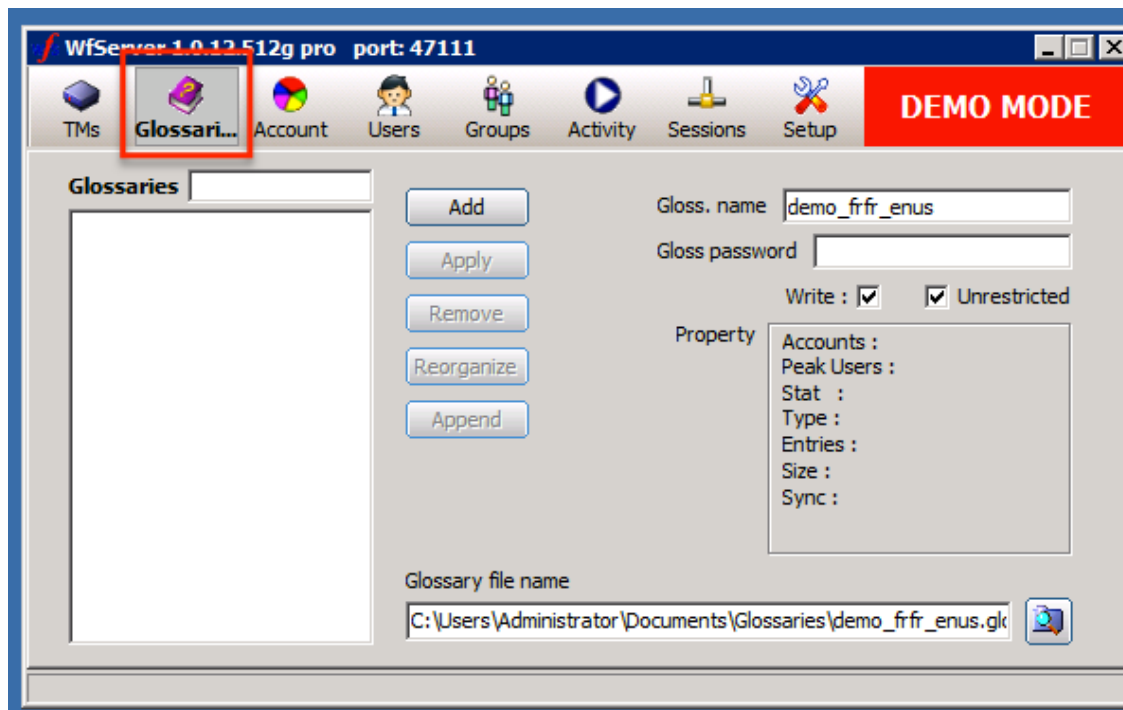

Wordfast Server Quick Start Guide 1.4

Creating a New Glossary

1. To create a new glossary in WFS, repeat the same process for creating a TM but in the **Glossary** tab. You can use the file extension .glo instead of .txt to make it easier to distinguish between TMs and glossaries. Do not assign a glossary password. *NOTE: If the **Write** box is checked, the added glossary is in read-write mode.*
2. If you wish to add a pre-existing glossary file, repeat the same process for adding a TM in the **Glossary** tab and with a glossary file. *NOTE: Because glossaries in WFP are stored in an internal database, you will first have to export the desired glossary to a .txt glossary file.*

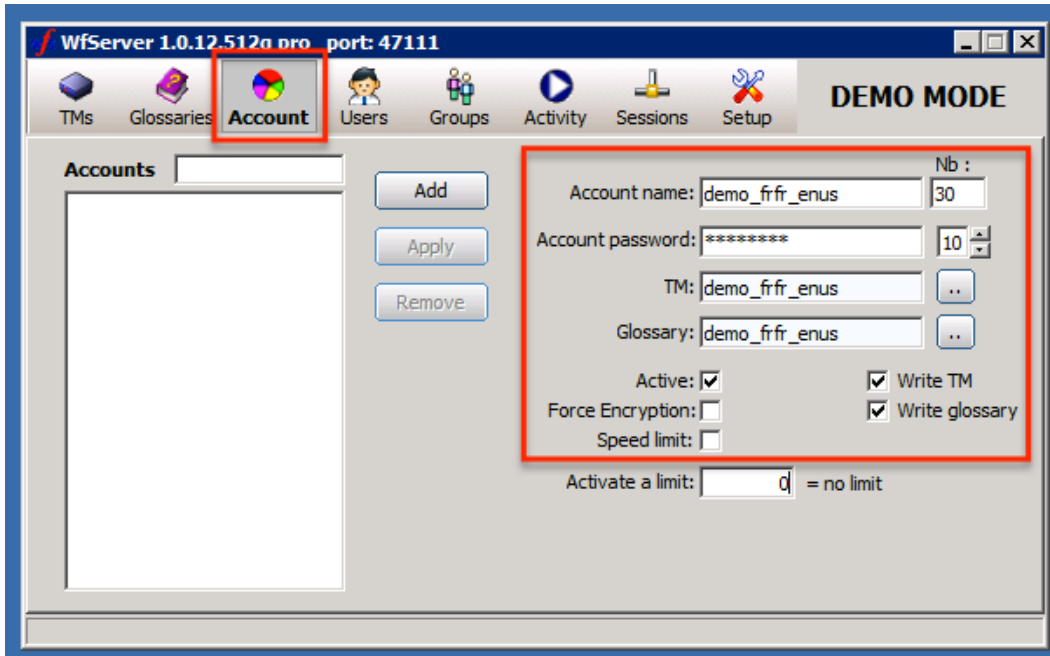

Wordfast Server Quick Start Guide 1.4

Creating an account to connect to WFS TMs and glossaries

1. To enable connections to WFS, go to the **Account** tab and do the following:

2. Enter a name in the **Account Name** field and a password into the **Account Password** field. To simplify, you can use the same name you used for the TM and glossary.
3. Click the  button next to the **TM** field and assign a TM from the drop-down list to this account.
4. Click the  button next to the **Glossary** field and assign a Glossary from the drop-down list to this account.
5. In the **Nb** field, enter the maximum number of users that can connect to the account simultaneously. We suggest 30. *WARNING: A number that is too low may prevent users from connecting.*
6. Check the **Active** option to enable the account and click **Add** to save the account settings.
NOTE: If the Write TM and Write glossary boxes are checked, the account TM and

Wordfast Server Quick Start Guide 1.4

*glossary are in read-write mode. If they are not checked, they are in read-only mode. If you change these settings, make sure to click **Apply**.*

Creating additional accounts for other TMs and glossaries

To create an additional account, you have to modify the name and password of an existing account, select the appropriate TM and glossary and click **Add**.

Wordfast Server Quick Start Guide 1.4

Verifying connection settings

1. Go to the **Activity** tab and make sure the **Server active** box is checked in order to start the server and make it available for use. *NOTE: If a Windows Firewall security alert appears, make sure to allow WFS access through the firewall.*

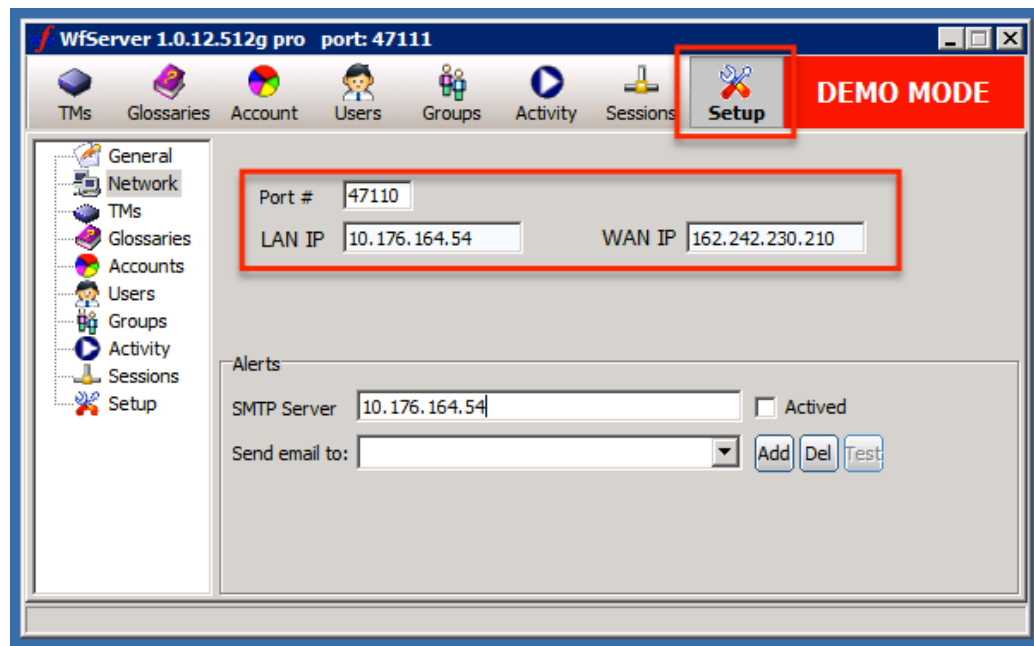

Wordfast Server Quick Start Guide 1.4

Connecting to a WFS account with Wordfast Pro (WFP)

1. To provide access to a given server account, provide WFP user(s) with the following:
 - a. The server **Account name** and **Password** (see **Creating an account...** section above).
 - b. The **IP Address** of the workstation where WFS is running from the WFS **Setup** tab > **Network** option. Use the LAN IP for local area network connections and the WAN IP for remote connections over the Internet.

- c. The **Port #** from the WFS **Setup** tab > **Network** option. *NOTE: The **Port #** will be 47110 by default. If you change the **Port #** manually you must restart WFS to apply the port change. The computer must have that particular port open for communication.*
 - d. If necessary, a WorkGroup ID. A workGroup ID can be any 10 character code that you choose. The code can contain letters, numbers and/or special characters. **WARNING:** the characters i, l, o, l, and O are not allowed. Workgroup IDs are used for more complicated workflows.

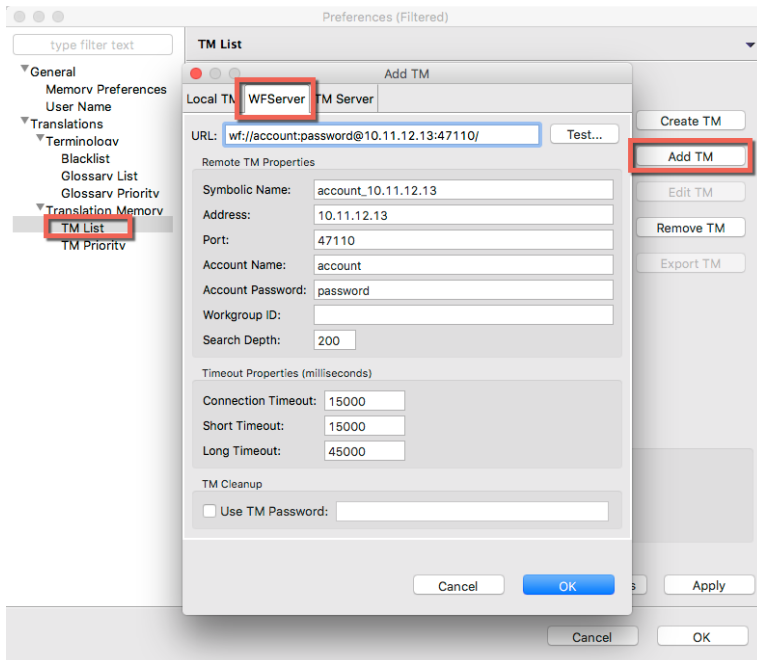

Wordfast Server Quick Start Guide 1.4

NOTE: If you put all the information in the following format:

wf://AccountName:AccountPassword@IPAddress:Port#/WorkGroupID

WFP user(s) can enter it in the URL field of the Add TM > WFServer setting and press Tab to automatically enter all the connection settings. Inversely, you can generate the URL in the same Add TM > WFServer location by filling out each field (Username, Password, Address, Port, Workgroup ID) separately.
